

8. ACKNOWLEDGEMENTS

A considerable number of persons has given assistance or supplied information relevant to this project.

The project could not have been undertaken without the expertise, enthusiasm and effort of Jennifer Hacker (Civil Engineering Department) and Marshall Butterworth (Geology Department). Much of the field work and most of the laboratory analyses have been carried out by them or under their supervision.

The director of Heron Island Research Station, Dr Ian Lawn, has provided use of facilities and station personnel to assist in the field work. In particular the daily observations of spoil dump conditions have been made, and are continuing to be made, by a number of persons, including Myriam Prekker, Lesley Newman, Andrew Flowers, Elna Anastasiou, Kathy Brundler, Lindy Hayes, Sandra Whittingham, Pippi Lawn and Tim Daley.

Brian Fenn of the Buildings and Grounds section of The University of Queensland provided liaison with the contractor who supplied the backhoe used in excavating test pits in the spoil dump.

Dr Bryan Hacker assisted in the field work on the spoil dump, particularly in making the auger holes.

Myriam Prekker supplied information concerning water temperature on Heron Island reef.

Professor Ted White (Chemical Engineering Department, The University of Queensland) made the laser size analyser available for our use.

Various National Parks and Wildlife Service personnel supplied information and photographs concerning events during and following the boat harbour enlargement works as well as aerial photographs of the spoil dump taken since that time.

Alan Grummitt and Mike Neale (Cullen, Grummit and Roe) supplied information about the boat harbour enlargement works.

John Broadbent and Ray Peddersen of the Department of Harbours and Marine provided analyses of tides at Heron Island. They also arranged for the supply of a tide board.

Dr Rod Rodgers (Botany Department, The University of Queensland) identified the various plant species growing on the spoil dump.

The Manager of Heron Island Resort agreed to the installation of the tide board on one of the jetty piles and made equipment available for doing this.

The text of this report was prepared in the Department of Civil Engineering of The University of Queensland by Ann Sellars. The figures were drawn by Reg Stonard (Department of Civil Engineering) and Elvira Burdin (Department of Geology and Mineralogy).
