

ACKNOWLEDGMENTS

A long-term water quality research program measuring temporal and spatial variability in Great Barrier Reef flood plumes could not have been achieved without the efforts, cooperation and commitment of a large number of people.

In particular we would like to thank:

- David Haynes, Rob McGill and Andrew Stevens (Great Barrier Reef Marine Park Authority), Alan Mitchell, Martin Lourey and the staff of the Long-term Monitoring Program (Australian Institute of Marine Science), Darren Mylrea (James Cook University), Glen Chisholm and Paul Leeson (Queensland Department of Primary Industries), and the Master and crew of the research vessels *Sirius* (Australian Institute of Marine Science), *Satisfaction* (Cairns), *Aquarius 3* (Cairns), and the crew of the Queensland Department of Primary Industries (Cairns) and Queensland Parks and Wildlife Service vessels based at Dungeness and Cairns for their assistance with field work.
- Donna Audas and the Geographical Information Systems unit of the Great Barrier Reef Marine Park Authority, who have helped to create the maps presented in this report. Their advice was invaluable. Thanks also to the Queensland Department of Natural Resources for information on flow rates and coverages, the Queensland Bureau of Meteorology for weather data, and the Australian Institute of Marine Science for use of the laboratories and equipment.
- Katharina Fabricius and Miles Furnas (Australian Institute of Marine Science) and David Haynes (Great Barrier Reef Marine Park Authority) who provided critical reviews of the draft manuscript.
