
TABLE OF CONTENTS

Executive Summary

1	Introduction	1
2	Background information	2
2.1	Coral taxonomy	3
2.2	The life cycle of corals	3
3	Damage and recovery of coral communities	9
3.1	Natural damage	9
3.2	Man-induced changes	9
3.3	Predation by crown-of-thorns starfish	10
4	Applications for accelerated recolonisation	11
5	Transplanting corals	12
5.1	Selection of corals	12
5.2	Collection and transportation	15
5.3	Placement at transplant site	15
6	Alternative methods for accelerating regrowth	19
6.1	Selection of coral transplants to maximise sexual reproduction	19
6.2	Increasing settlement surfaces	19
6.3	Restocking from artificially raised corals	20
7	Effects on the collection site	21
8	Costs of rehabilitation	23
9	Acknowledgments	24
10	References and further reading	25
	Appendix 1 Experimental results	27
	Appendix 2 Costs of simulated transplanting exercise	40

FIGURES

1	Photographs of pocilloporid and massive corals	4-5
2	Photographs of <i>Acropora</i> and <i>Porites</i> corals	6-7
3	Some growth forms of common coral species	8
4	Photographs of 3 types of corals 6 months after transplantation	13
5	Rosette tip of a transplanted <i>Acropora</i>	14
6	Attachment of a coral branch with a cable tie	17
7	Photographs of carefully placed and attached corals	18
8	Survival rate of transplanted coral fragments, expt 2	30
9	Survival rate of transplanted coral fragments, expt 3	31
10	Effect of fragment size on coral survival, expt 4	32
11	Effect of placement method on coral survival, expt 6	35
12	Effect of exposure on transplant survival, expt 7	37
13	Effect of exposure on transplant survival for 2 coral taxa, expt 8	39

TABLES

1	Families and genera of hard corals	2
2	Effect of transplantation on the collection site	21
3	Collection effort for different coral types, expt 1	28
4	Coral cover 5 months following transplantation, expt 1	29
5	Survival of branched and unbranched <i>Acropora</i> fragments	34
